EDUCATION

Ateneo de Manila University

Expected May 2028

Bachelor of Science in Computer Science

Philippine Science High School, Main Campus

2018 – 2024

EXPERIENCE

Programming Varsity of the Ateneo (ProgVar)

2024 – Present

Member

- Train weekly in algorithms and data structures and compete in ICPC-style contests. Solved **547 distinct problems** across **27 rated contests** on Codeforces and AtCoder.
- Peaked at **1526 on Codeforces (Specialist)**, with a best contest placement of **1105th**.

Learn-2-Dev 2026

2026

Trainer

- Taught React fundamentals to fellow students over a **6-week** program: components, props, state, and hooks.
- Wrote the session walkthroughs, live-coded the examples, and debugged participants' code with them during class.

PROJECTS

Portfolio Site | *Next.js, TypeScript, TailwindCSS, Neon Postgres, Vitest, Vercel* | kenazc.com | GitHub

July 2026

- Built a fully keyboard-driven portfolio site on the Next.js App Router over **173 commits**, styled after the Persona 5 Royal menu with no game assets.
- Pull live ratings, contest history, and solved counts from the Codeforces and AtCoder public APIs. When either API is unreachable the section falls back to static content rather than breaking the layout.
- Wrote the attributes radar, rating line charts, and difficulty histograms as raw SVG, which kept a charting library out of the bundle.
- Store projects and contest results in Neon Postgres and serve them through ISR, so a new row reaches the live site in under a minute with no redeploy. Covered with Vitest in CI.

Yardshtick | *Next.js, TypeScript, TailwindCSS, OpenAI API, Convex* | Live | GitHub

July 2026

- Won **3rd place out of 60 teams** at the OpenAI Build Week Community Buildathon Manila 2026.
- Built the seller and buyer web app that turns one photo of a pile of objects into editable garage-sale listings and a shareable storefront, with title, description, and price drafted through the OpenAI API.
- Consumed the backend through a shared **YardService** contract, so the frontend ran against a mock implementation while the AI pipeline was still being written.
- Rendered live scan output over uploaded images, including bounding boxes, polygons, and per-item metrics, and gave failed scans explicit error states instead of a blank screen.

Project Sinag | *Next.js, Nitro, Prisma, PostgreSQL, TailwindCSS, shadcn/ui* | Live

2025

- Built with Team McCoders at a hackathon, going from idea to working demo inside a **24-hour** window.
- Shipped a full-stack web app on Next.js with a Nitro backend and Prisma over PostgreSQL for type-safe queries.

AWARDS

3rd Place out of 60 teams, OpenAI Build Week Community Buildathon Manila (2026)

Finalist, UP ACM Algolympics 2026, Team KMP

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, C++, Java, HTML, CSS

Libraries & Frameworks: React, Next.js, Node.js, TailwindCSS

Databases & Tools: PostgreSQL, Neon, Prisma, Git, Vercel

Competitive Programming: C++ and Python. Codeforces @RamenNagi, AtCoder @RamenNagi
